This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1902 edition. Excerpt: ...said to have been discovered about 200 years ago. Since 1854 its yield has gradually increased. Numerous metalliferous veins here occur traversing liparite. The thickness of the veins is generally 4 or 5 inches, but is sometimes as much as 3 or 4 feet. The veins consist of barite and quartz, containing native gold associated with zinc blende and iron pyrites. Yield of gold from the Kanahira Mine. Momma. 1896 2,290 1897 7.357 1898 6,326 1899 7.255 1900 5,287 The Hoshino Mines.--The mining district thus designated is in Hoshino-mura, Yame-gori, Chikugo Province. It lies about 5 ri east of the town of Fukushima and 6 n distant from Hainuzuka railway-station. There are several gold mines here worked in a primitive way, and we include this group of mines under the name of the Hoshino Mines. The quartz veins are in augite-andesite, protruding through the Palaeozoic formation. They are impregnated with iron sulphide or rarely with zinc blende and contain a small quantity of gold and silver. The veins generally strike E.S.H. and are 10 to 20 feet thick. The most productive of these mines are those known respectively as the Komuro mine and the Yano mine. The total yield of gold in 1899 was 10,897 niommc. Serigano Mine.--The Serigano Mine is in Kushigino-mura, Hioki-gori, Satsuma Province and is conveniently situated, being adjacent to the highway leading to Kagoshima, the principal city in Satsuma, and about 10 ri north of that place. The mine was discovered in 1652 and opened in 1658. Since that time, it has been continuously worked, though it has never been very productive. Augite-andesite constitutes the country rock in this vicinity, and it is traversed by numerous metalliferous veins of which those known as the Yagi-bi, Umenoki-bi, Uba-bi,...
